TOP 5 INTEGRATION FEATURES
Of Office 365 And SharePoint Online
Microsoft has breathed new life into SharePoint, one of the most used platforms for collaboration, document management, team collaboration, IT support, web portals, project management, financial reporting, forms routing, and much more.

The problem is very few companies take the time to maximize what Office 365 can do.

SharePoint Online improvements over the last year include upgrades that drastically impact users in terms of transporting cloud-based Office 365 capabilities onto the SharePoint platform.
The ability to leverage Office 365 Groups, which delivers a means of group communication, is a solid alternative to popular messaging applications, such as Slack.

Using Groups gives your team the ability to view, edit, share all group files, view and schedule group meetings with ease allowing for better communications among team members.
2 Utilize New Microsoft Flow Capabilities

The new workflow capabilities of Microsoft Flow feature code-free interaction with hundreds of third-party services such as:

- Salesforce
- Zendesk
- Facebook
- OneDrive
- SharePoint
- Microsoft Dynamics
- And more

Microsoft Flow puts real power in the hands of regular users by easily connecting and automating services vital to your business.
Granting external access in SharePoint Online is a breeze and no longer a time-consuming inconvenience.

Simply connect a Microsoft account to their company e-mail or create guest links to give users access to folders, individual files, and sites within your environment.
A new SharePoint Online layout includes recent site activity, which allows for a more mobile-friendly content display, and other features such as:

- Rich Text
- Images
- Videos
- News
- Highlighted Content
- Customizable Dashboard

Mobile SharePoint access used to be a nightmare due to the lack of responsive design. You can now access SharePoint from anywhere and communicate with your team remotely to get more work done with ease.
You can now embed Power BI reports to a SharePoint page - display charts, dashboards, reports, KPIs, etc. on your SharePoint site to make the information readily available to users.

Additionally, the analysis/metrics tools are now available within the program instead of having to import them; so significant time is saved on importing data from other sources.
If you properly implement SharePoint, it will transform your company’s productivity. Employees will be more efficient, you’ll have better access to your company’s data, and you’ll be able to better report on key metrics.

HingePoint’s custom SharePoint solutions have helped many companies struggling with unorganized data and manual, multi-step processes. Those same customers have transitioned into a more organized, productive organization through automated workflows and easy-to-search information.
About HingePoint

HingePoint offers cloud and mobile applications for construction and real estate that are easy to adopt and employees love.
